

Using Groups in MegaMath

Many teachers have varied ability levels or groups in their classroom. MegaMath allows for the creation of groups so that assignments can be given to separate groups within a class, according to their ability level.

To create a group:

- Login as teacher
- Click on Manage Classes
- Click the Add button (bottom right side)
- Bubble in for Group (rather than student or class), and click OK
- Name your group in the box at the top of the page and choose your class from the dropdown next Class
- Click Save at the bottom of the page

Now, if you click on the green triangle next to your class name in the left panel you should see the group you just created.

Students can be added to groups as you are adding them, OR you can move a student into a group by selecting his name and choosing from the group dropdown menu.

Assignments can be given to groups. The only difference between giving an assignment to a group and giving an assignment to a class is that you must select the group (in the right-hand panel- make it red) rather than selecting the class. This process was demonstrated during our training session.
